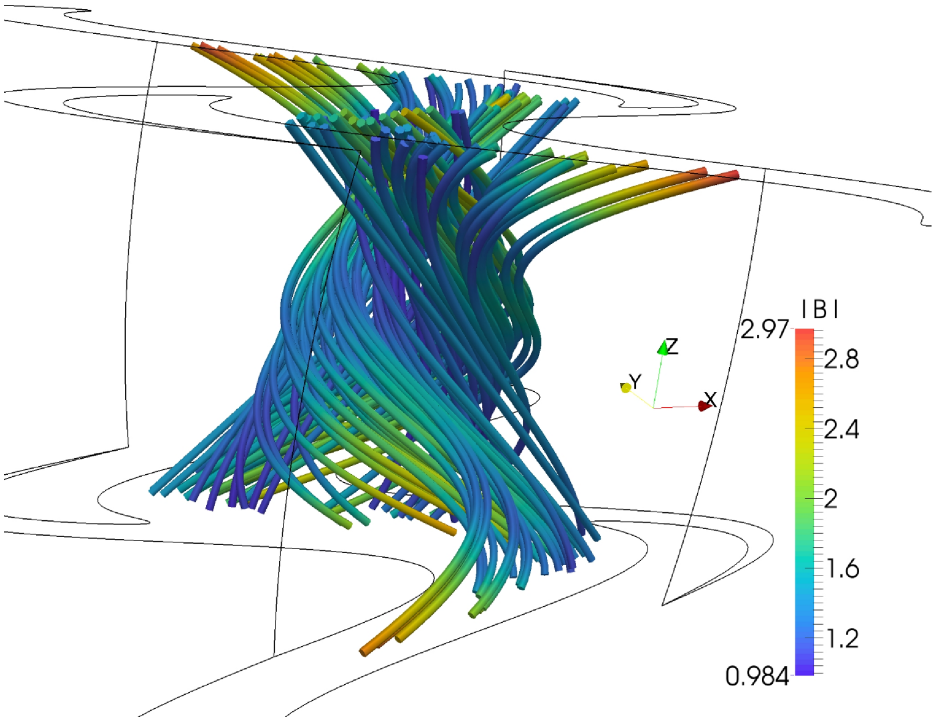
# Topology Conserving Magnetic Field Relaxation in Plasma

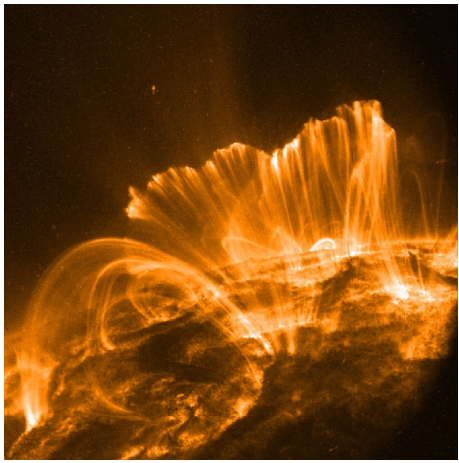
**S. Candelaresi**, D. Pontin, G. Hornig



# Magnetic Field Relaxation

Solar corona: low plasma beta and magnetic resistivity

NASA



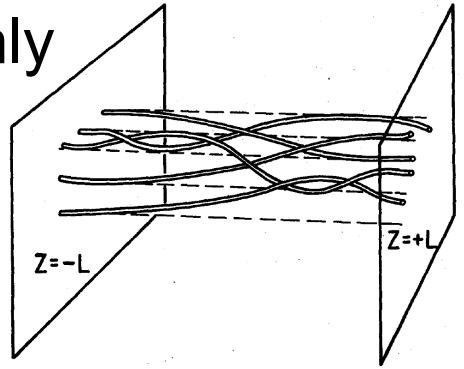
⇨ Force-free magnetic fields

⇨ Minimum energy state

$$(\nabla \times \mathbf{B}) \times \mathbf{B} = 0 \;\Leftrightarrow\; \nabla \times \mathbf{B} = \alpha \mathbf{B}$$

**Parker:** Equilibrium with the same topology exists only if the twist varies uniformly along the field lines.
Strongly braided fields → topological dissipation.

*(Parker 1972)*



Braided fields from foot point motion complex enough. *(Parker 1983)*

Solutions possible with filamentary current structures (sheets).

*(Mikic 1989, Low 2010)*

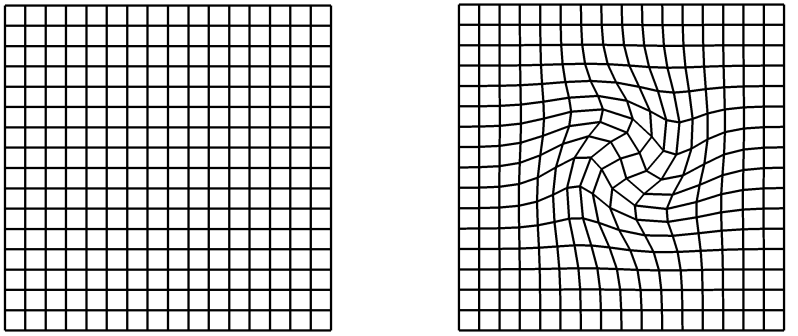
# Ideal Field Relaxation

Ideal induction eq.: $\dfrac{\partial \mathbf{B}}{\partial t} - \nabla \times (\mathbf{u} \times \mathbf{B}) = \mathbf{0}$

Lie-transport:

$$\frac{\partial}{\partial t}\beta(\mathbf{X}, t) + \mathcal{L}_{\mathbf{u}}\beta(\mathbf{X}, t) = 0$$

$\mathbf{x}(\mathbf{X}, 0) = \mathbf{X}$ $\mathbf{x}(\mathbf{X}, t)$



Pull-back:

$$(\mathbf{x}^*(t)\beta)(\mathbf{X}, t) = \beta(\mathbf{X}, t)$$

Field evolution: $B_i(\mathbf{X}, t) = \dfrac{1}{\Delta}\displaystyle\sum_{j=1}^{3} \frac{\partial x_i}{\partial X_j} B_j(\mathbf{X}, 0)$

$$\Delta = \det\left(\frac{\partial x_i}{\partial X_j}\right)$$

Preserves topology and divergence-freeness.

# Ideal Field Relaxation

Magneto-frictional term: $\mathbf{u} = \mathbf{J} \times \mathbf{B}$ $\mathbf{J} = \nabla \times \mathbf{B}$

$$\Rightarrow \frac{\mathrm{d}E_\mathrm{M}}{\mathrm{d}t} < 0$$ *(Craig and Sneyd 1986)*

Fluid with pressure: $\mathbf{u} = \mathbf{J} \times \mathbf{B} - \beta \nabla \rho$

Fluid with inertia: $\mathrm{d}\mathbf{u}/\mathrm{d}t = (\mathbf{J} \times \mathbf{B} - \nu \mathbf{u} - \beta \nabla \rho)/\rho$

For $\mathbf{J} = \nabla \times \mathbf{B}$ use mimetic numerical operators.

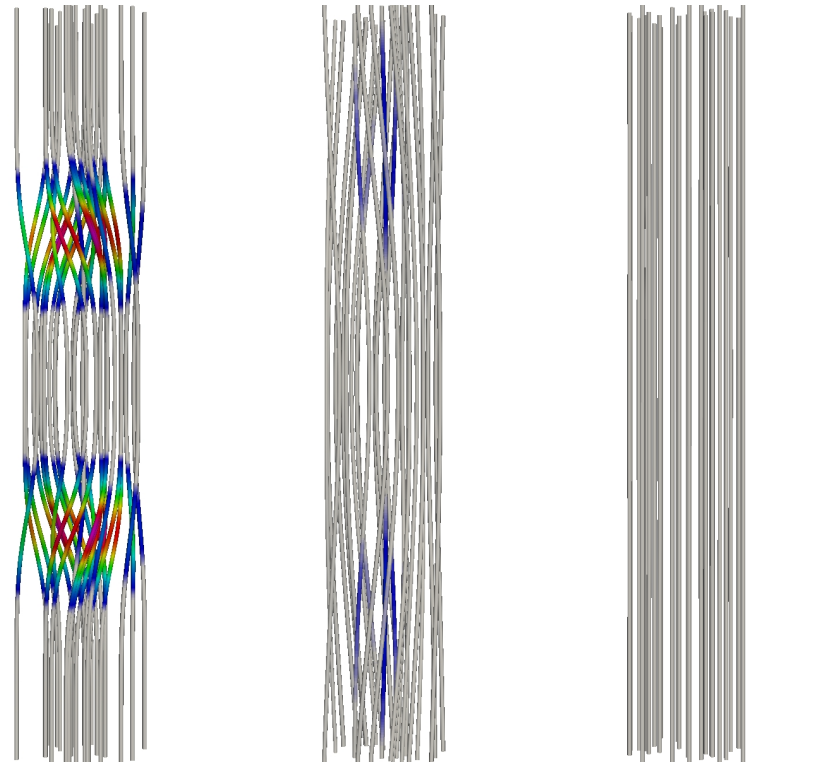
$\nabla_\mathrm{m} \cdot \nabla_\mathrm{m} \times \mathbf{B} = 0$ $\nabla_\mathrm{m} \times \nabla_\mathrm{m} f = 0$ *(Hyman, Shashkov 1997)*

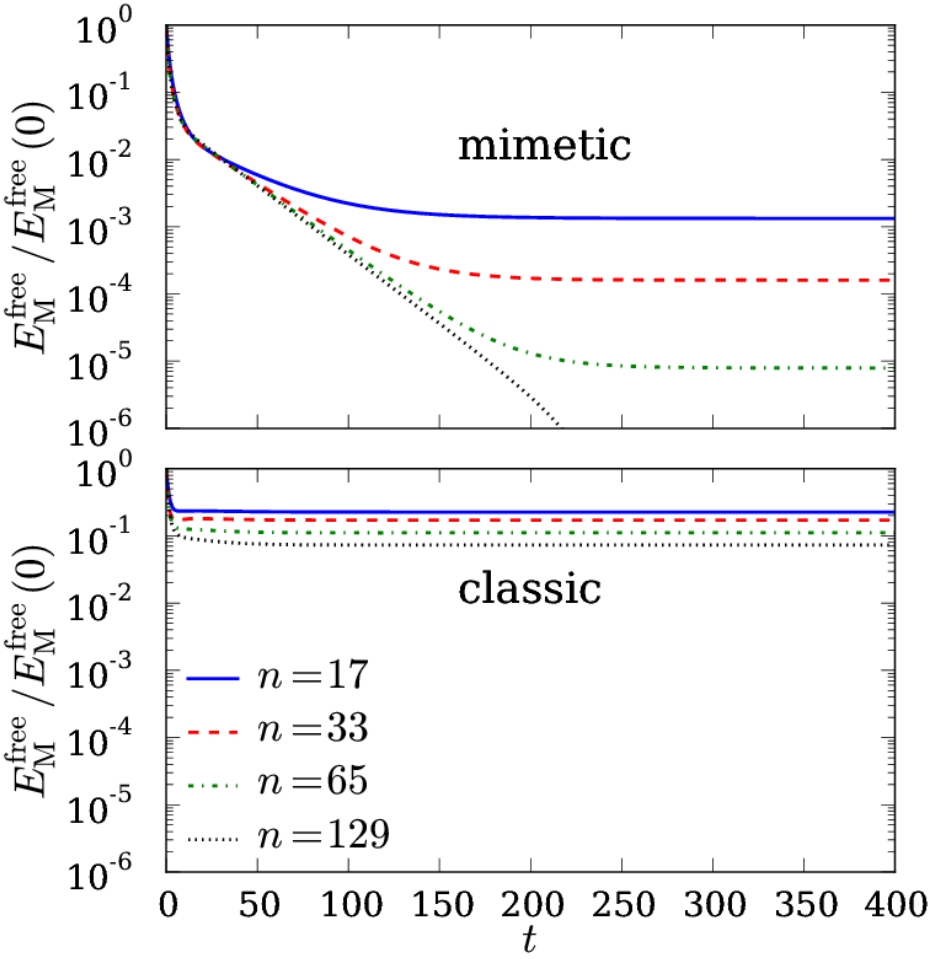
Own GPU code GLEMuR: (https://github.com/SimonCan/glemur)

*(Candelaresi et al. 2014)*

# Proof of Concept

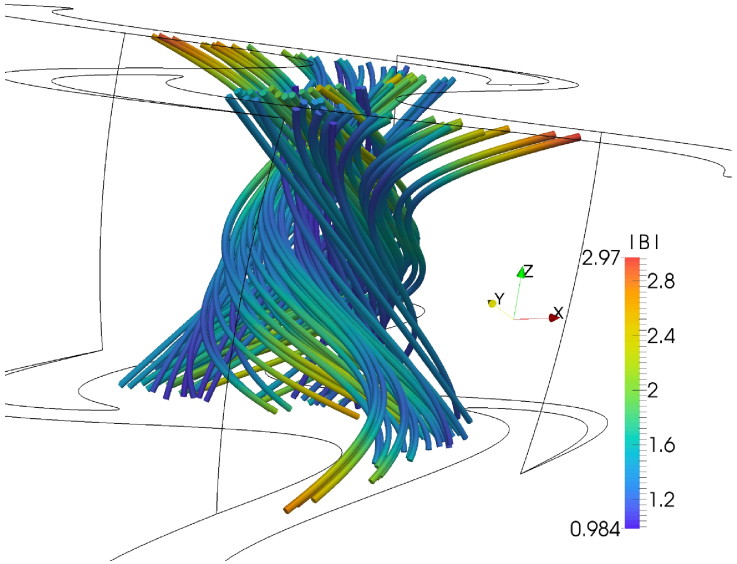
Magnetic streamlines:

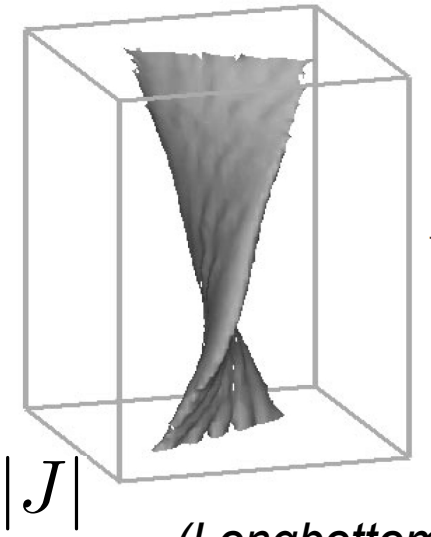


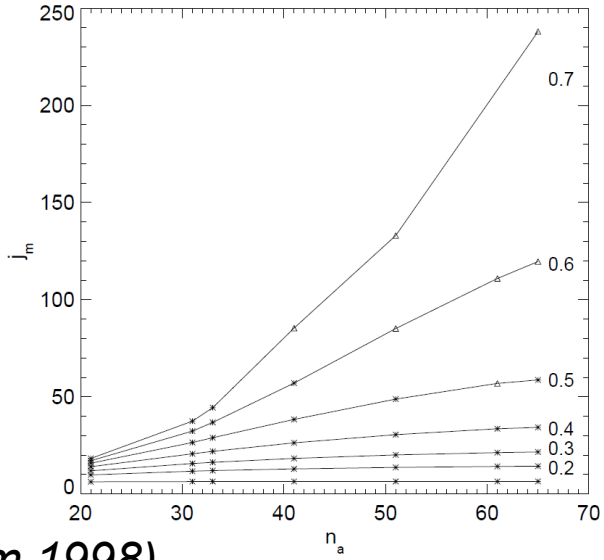


*(Candelaresi et al. 2014)*

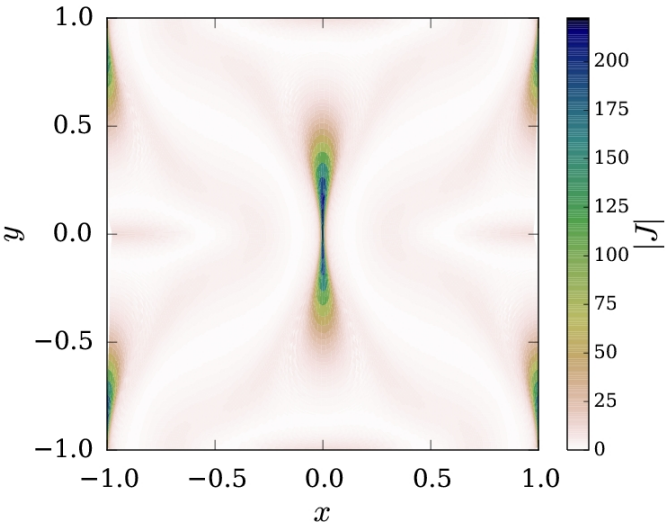
# Distorted Magnetic Fields

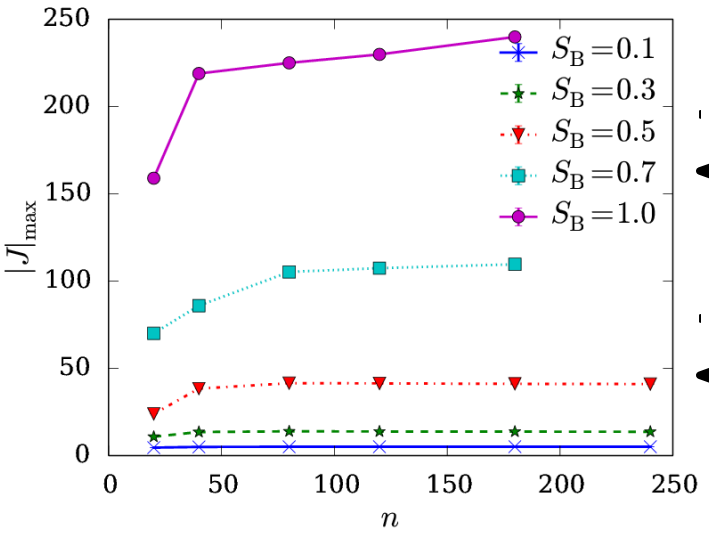






*(Longbottom 1998)*





- resolved current concentrations
- shear leads to strong currents

*(Candelaresi et al. 2015)*

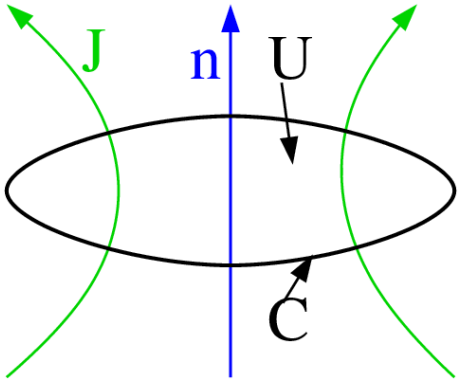
# Conclusions

- Topology preserving relaxation of magnetic fields.
- GLEMuR: (https://github.com/SimonCan/glemur)
- Current concentrations not singular.
- Current increases strongly with field complexity.

simon.candelaresi@gmail.com

# Mimetic Numerical Operators

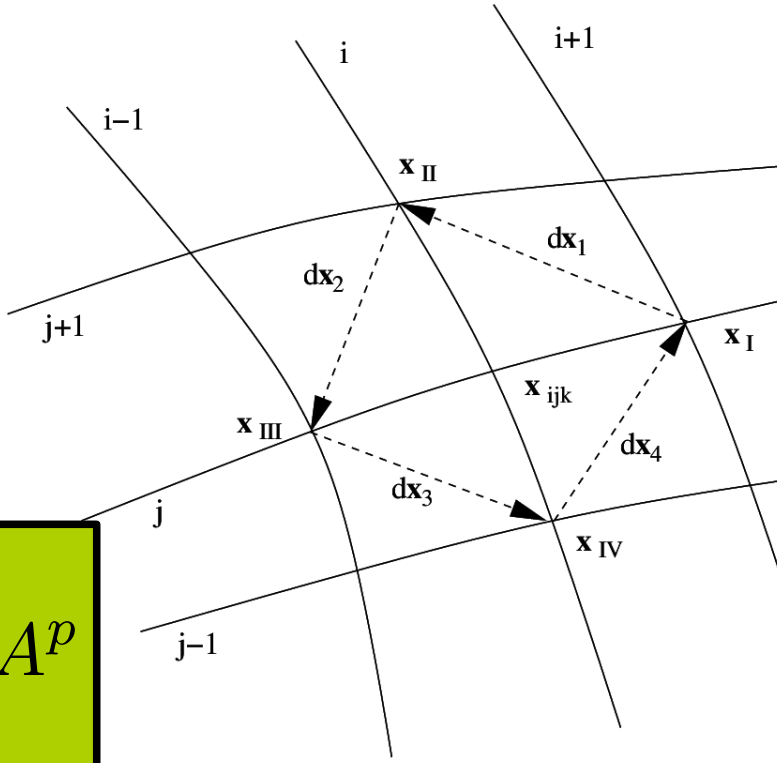
$$I = \int_U \mathbf{J} \cdot \mathbf{n} \, \mathrm{d}S = \oint_C \mathbf{B} \cdot \mathrm{d}\mathbf{r}$$



Discretized:

$$I \approx \mathbf{J}(\mathbf{X}_{ijk}) \cdot \mathbf{n}A = \sum_{r=1}^{4} \mathbf{B}_r \cdot \mathrm{d}\mathbf{x}_r$$

$$\mathbf{J}(\mathbf{X}_U) \approx \mathbf{J}(\mathbf{X}_{\mathbf{ijk}}), \quad \mathbf{X}_U \in U$$



3 planes will give 3 l.i. normal vectors:

$$I^p = \mathbf{J}(\mathbf{X}_{ijk}) \cdot \mathbf{n}^p = \sum_{r=1}^{4} \mathbf{B}_r^p \cdot \mathrm{d}\mathbf{x}_r / A^p$$

Inversion yields $\mathbf{J}$ with $\nabla \cdot \mathbf{J} = 0$.

*(Hyman, Shashkov 1997)*

# Quality Parameters

For a force-free field: $\nabla \times \mathbf{B} = \alpha \mathbf{B}$

$$\mathbf{B} \cdot \nabla \alpha = 0$$

Force-free parameter does not change along field lines.

Measure the change of $\alpha^* = \dfrac{\mathbf{J} \cdot \mathbf{B}}{\mathbf{B}^2}$ along field lines:

$$\epsilon^* = \max_{i,j} \left( a_r \frac{\alpha^*(\mathbf{X}_i) - \alpha^*(\mathbf{X}_j)}{|\mathbf{X}_i - \mathbf{X}_j|} \right); \quad \mathbf{X}_i, \mathbf{X}_j \in s_\alpha$$

Particular field line: $s_\alpha = \{(0, 0, Z) : Z \in [-L_z/2, L_z/2]\}$

# Quality Parameters

Deviation from the expected relaxed state:

$$\sigma_{\mathbf{x}} = \sqrt{\frac{1}{N}\sum_{ijk}(\mathbf{x}(\mathbf{X}_{ijk}) - \mathbf{x}_{\mathrm{relax}}(\mathbf{X}_{ijk}))^2}$$

$$\sigma_{\mathbf{B}} = \sqrt{\frac{1}{N}\sum_{ijk}(\mathbf{B}(\mathbf{X}_{ijk}) - \mathbf{B}_{\mathrm{relax}}(\mathbf{X}_{ijk}))^2}$$

Free magnetic energy:

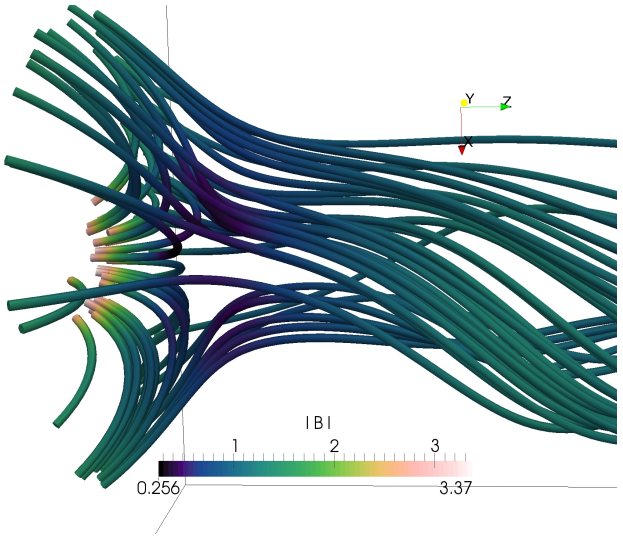
$$E_{\mathrm{M}}^{\mathrm{free}} = E_{\mathrm{M}} - E_{\mathrm{M}}^{\mathrm{bkg}}$$

$$E_{\mathrm{M}} = \int_V \mathbf{B}^2/2 \ \mathrm{d}V \qquad \mathbf{B}^{\mathrm{bkg}} = B_0\hat{e}_z$$

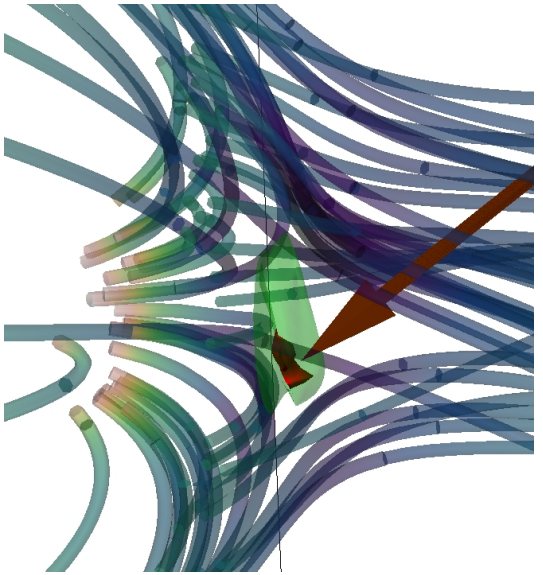
# Magnetic Nulls

Singular current sheets observed at magnetic nulls (B = 0)

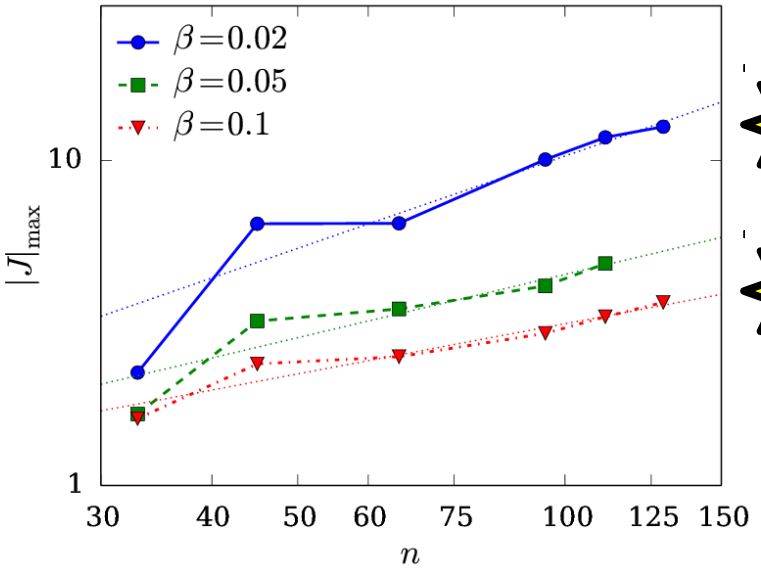
*(Syrovatskiĭ 1971; Pontin & Craig 2005; Fuentes-Fernández & Parnell 2012, 2013; Craig & Pontin 2014)*



$$\mathbf{u} = \mathbf{J} \times \mathbf{B}$$



$$\mathbf{u} = \mathbf{J} \times \mathbf{B} - \beta \nabla \rho$$



- singular current sheets at magnetic nulls
- Pressure cannot balance singularity.

# Code Details

- written in C++
- running in GPUs
- VTK data format
- 6th order Runge-Kutta time stepping
- periodic and line-tied boundaries
- post processing routines in Python

```
// compute the norm of JxB/B**2
__global__ void JxB_B2(REAL *B, REAL *J, REAL *JxB_B2, int dimX, int dimY, int dimZ) {

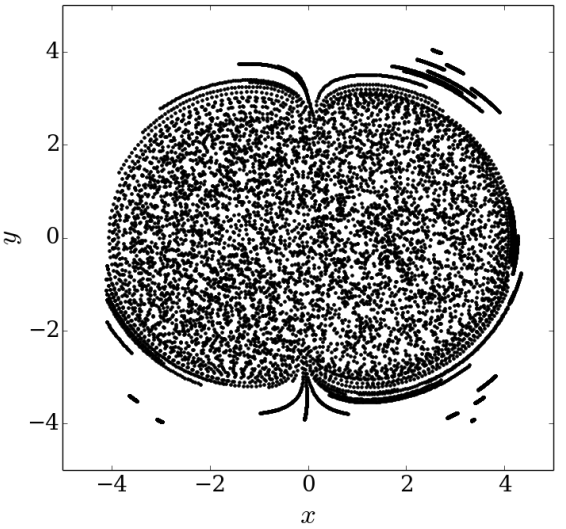
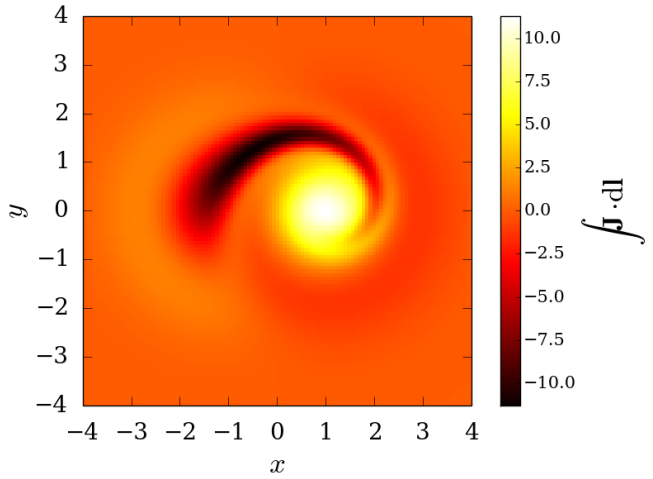
## Poincaré maps



## line integration



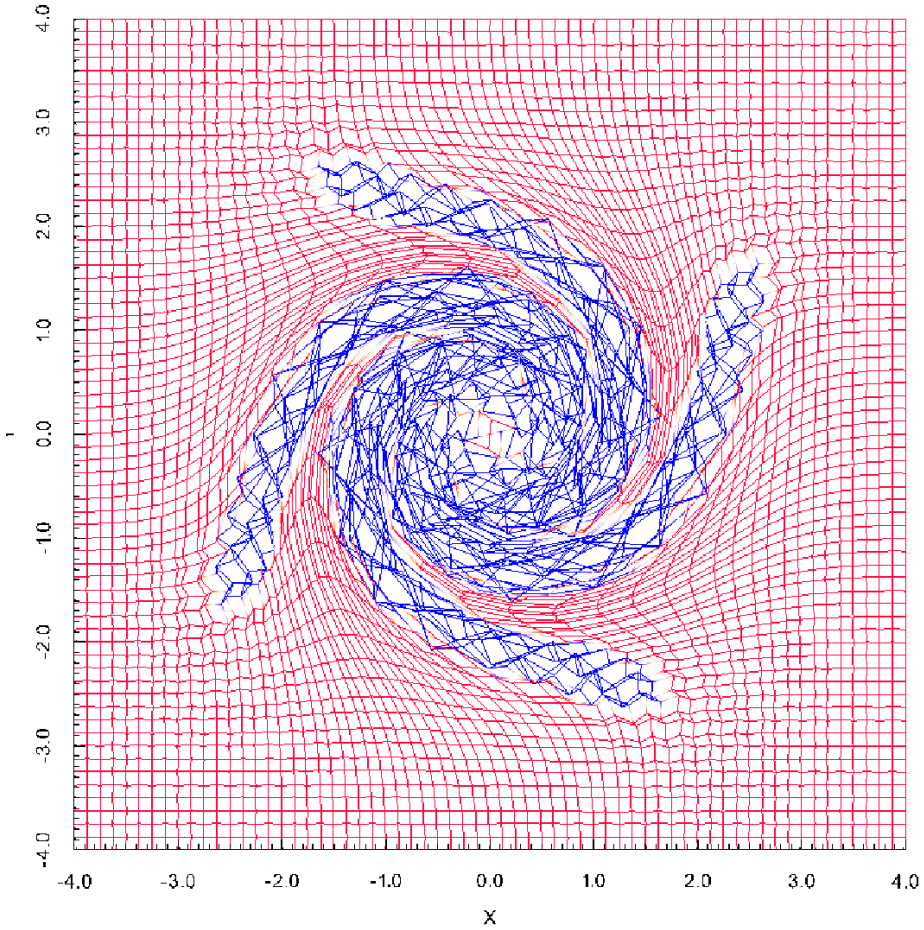
## save and read as vtk file

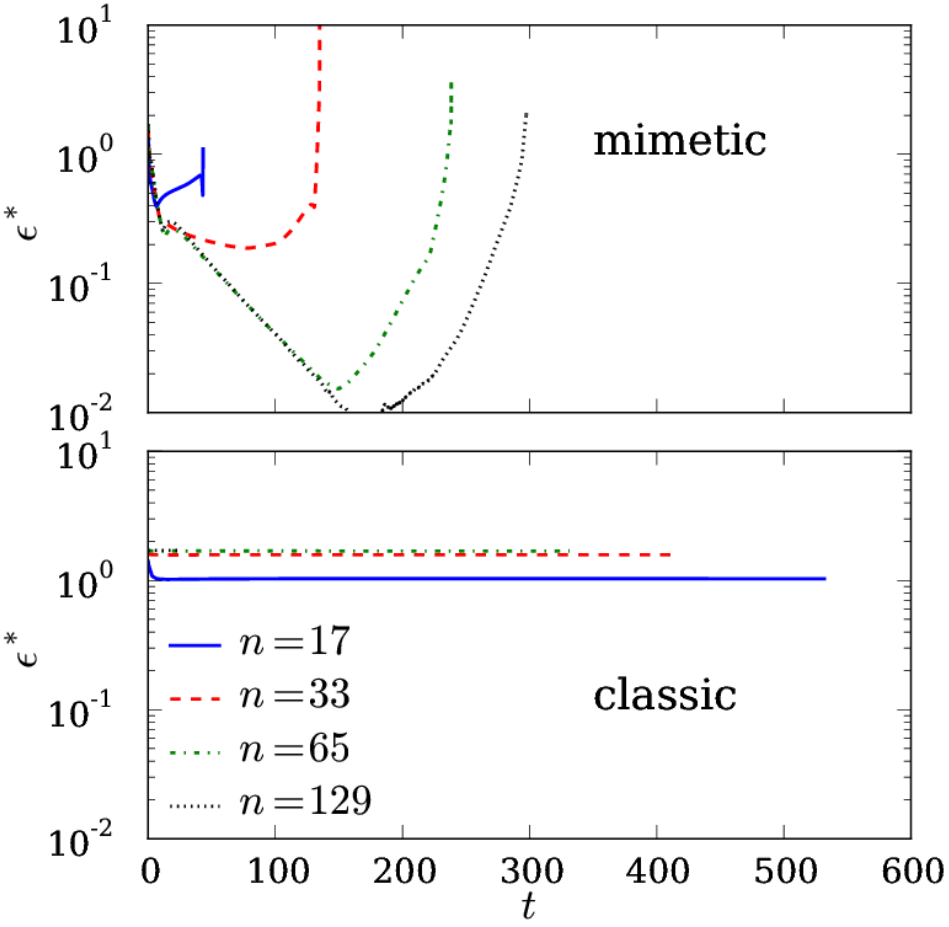
```
s0 = gm.streamInit(tol = 0.01)
```

```
stream.vtk
```

```
sr = gm.readStream()
```

# Limitations





red: convex
blue: concave

For concave cells the method becomes unstable.
**But**: results before crash better than classic method.
